

Problem 15	Choice of mechanized method of operation at wells (exploration wells) with stepped intermediate casing strings.
The essence of the problem	It is difficult to produce from old exploration wells with narrow diameter design (complication of underground repair, increase in costs).
Technological parameters	Selection of the most economical system of mechanized production using small-sized equipment with assessment of initial costs, operation costs, production capabilities, etc.
Scale of the problem	Loss of production from stopped wells.
